Disciplinary process  
Termination or change of employment

## 1. Human Resources Security

Clause 5.2.1 of the standard requires the organization to provide appropriate and adequate resources to carry out all the Plan—Do—Check—Act (PDCA) phases of information security management. Clause 5.2.2 requires that whoever is assigned an ISMS-related task has the necessary competence. These two clauses can be satisfied at the same time as the required controls are constructed. It will be necessary to demonstrate, in the documentation, how the competences were determined, and why.

### 1.0.1 Job descriptions and competency requirements

Should contain 1) a description of the competencies need 2) a statement that every employee is required to be aware of the organization's info sec policy. Attention should be drawn to the responsibility to protect assets from unauthorised access, disclosure, modification, destruction or interference. Job description should set out clearly that breach of information security controls may be considered a misdemeanour under the organization's disciplinary policy and that breach of them might, under specific circumstances, result in dismissal.

### 1.0.2 Screening

Control A.8.1.2 of the standard requires the organization to carry out verification checks on permanent staff, contractors and third parties at the time of job applications. The organization should identify who will be responsible for carrying this out, how it will be done, how the data will be managed and who will have what authority in respect of the data and the recruitment process. For some roles criminal screening must be done. There are four (actually 5?) basic checks that should be completed.

1. Character reference checks, one personal and one business. Preferably written, but might be a signed transcript of a phone call carried out by a person experienced with phone call reference checks.
2. A completeness and accuracy check of the CV, usually carried out by written references supplied by previous employers. It is critical that the employer is methodical in ensuring that all facts are true.
3. Confirmation of claimed academic and professional qualifications, either by means of obtaining from the candidate copies of the certificates or other statement of qualification or through an independent CV checking service.

4. There should be an independent identity check against a passport or similar document that shows a photograph of the employee.
5. Finally, the individual's entitlement to live and work in the country should be confirmed, by reference to appropriately endorsed travel or work documents.

A draft contract can be agreed upon but not signed before the checks are completed. In some cases if the job only deals with low level of information people can start work before checks are completed.

Organizations should have records for existing staff of equivalent completeness to those required for new hires. This process should be done open and quickly, and staff should be aware of the process. If it is found that existing staff has incorrect or false CVs the organization will have to judge the extent it threatens info sec. There needs to be a procedure in place that allows new and/or inexperienced staff to have access to sensitive systems under supervision. The performance of staff that has access to sensitive information should be reviewed at least annually.

### 1.0.3 Terms and conditions of employment

employees, contractors and third parties all agree and sign an employment contract that contains conditions covering their and the org's responsibilities for info sec. It should include a confidentiality agreement that covers information acquired prior to and during employment, standard confidentiality agreement. If loopholes are found the documents should be amended, and if it is significant replace and re-sign existing confidentiality agreements and NDAs. The contract should make it clear that the employee has a responsibility for info sec. This responsibility must be described.

### 1.0.4 During employment

An organization has to ensure that employees, contractors, and third-party users are aware of information security threats as well as their responsibilities and liabilities, and that it has trained personnel appropriately. ISO25002's includes ensuring that staff are: properly briefed on their roles and responsibilities before they are granted access to sensitive information, or information systems. (information security threats, risks, and vulnerabilities) All staff must appropriate awareness training and other training, as well as regular updates and communications.

Any staff involved in handling payment card data, and working within a card—holder data environment as defined by the PCI DSS, will also need specific training on their responsibilities in regard to that data.

There are also a number of staff who will require other user—specific training. These include the staff identified at the beginning of this chapter as needing specific statements in their job descriptions and contracts of employment about their information security responsibilities. These include:

- the chief information officer;
- the information security adviser;
- members of the information security management forum;
- IT managers;
- network managers;
- IT and helpdesk support staff;
- webmasters;
- premises security staff
- HR, recruitment and training staff;
- general managers;

- finance staff;
- the company secretary and legal staff;
- internal quality assurance or system auditors;
- business continuity and emergency response teams.
- basically everyone except for the cleaning lady..

Clause 5.2.2 also requires the organization to maintain records of education, training, skills, experience and qualifications, and this requirement is satisfied by following the recommendations of this chapter and attaching these records to the individual's personnel file. More importantly, the effectiveness of the training must be evaluated, and this requires the specific objectives for each piece of training, and the criteria for measuring its effectiveness, to be identified and agreed in advance. This is in line with best practice for effective staff training.

### **1.0.5 Disciplinary process**

Employees that violate information security policies should be lashed accordingly. We will worry about finding/creating evidence of a breach later.

### **1.0.6 Termination or change of employment**

In many organizations employment termination is sloppy information security wise, as a result the organization creates new vulnerabilities. Control A.8.3.1 deals with termination responsibilities and simply requires the organization to document clearly who is responsible for performing terminations and what these responsibilities are. These responsibilities should clearly include dealing with the ongoing clauses in the contract of employment.

All organization assets should be returned, these assets fall into four categories: software, hardware, information and knowledge. The first two asset types are best dealt with procedurally through a centralized recording and authorization process; there should be a record for each employee (maintained by the HR or IT department) that lists all laptops, PDAs, mobile telephones and other hardware issued to employees. This list could be linked to the asset inventory. Information - classified documents, whether electronic or paper should be returned.

Control A.8.3.3, removal of access rights, is critical, as access rights may enable a disgruntled ex—employee to compromise a system. The organization needs a clear documented procedure to ensure that upon termination access rights are also terminated, These access rights include passwords, tokens and other authentication rights, e-mail and internet user accounts and user names, electronic files etc.

## 2. Physical and Environmental Security

### 2.1 Secure Areas

Control A.9.1 of the standard deals with secure areas. Its objective is to prevent unauthorized physical access, damage or interference to business premises and information. It has six sub-clauses. Critical or sensitive information and information processing facilities should be housed in secure areas protected by a defined secure perimeter, with appropriate security barriers (eg walls, fixed floors and ceilings, card-controlled entry gates) and controls (eg staffed reception desks) that provide protection against unauthorized access or damage to papers, media or information processing facilities. The protection implemented should be commensurate with the assessed risks and the classification of the information, and should take into account out-of—hours working and similar issues.

#### 2.1.1 Physical security perimeter

Organizations are required to use a security perimeter to protect areas that contain information processing facilities. If the risk is there, more than one physical might be used to increase total protection. A line should be drawn around the premises on the site plan, that needs to be protected. A perimeter in this context is something that provides a physical barrier between the organization and the outside world: walls, doors, windows, gates, floors, fixed ceilings (false ceilings hide a multitude of threats), skylights, etc. Special attention should also be given to lifts and lift shafts, risers, maintenance and access shafts, etc. A comprehensive risk assessment should be carried out to identify the weaknesses, vulnerabilities or gaps in this perimeter. The following controls should form part of the implemented security perimeter:

- The perimeter is defined in a document, and staff are aware of what and where it is.
- The perimeter should be physically sound. There should be no gaps. External walls should be of solid construction, and doors should be protected for unauthorized access.
- There should be a staffed reception to prevent unauthorized access.
- Physical barriers should be extended from real floor to real ceiling (ie below and above any false floor or false ceiling, particularly those installed to provide effective ducting for cabling) to prevent unauthorized entry or environmental contamination such as that caused by fire or flood.
- Fire doors should open out, should slam shut, and should be alarmed. This should be advertised to prevent false alarms, there should be CCTV to watch for this.

- Appropriate intruder detection systems should be professionally installed and maintained. All external doors and accessible windows should be covered and unoccupied areas should always be alarmed. Protocol for what to do when alarm goes off should be a part of ISMS.

### 2.1.2 Physical Entry Controls

Secure areas should be protected with appropriate entry controls. ISO27002 recommends specific controls:

- Visitors should be supervised or cleared in advance. Records with time stamps of visitors should be kept.
- Outsourced security services (Securitas) should be vetted independently, and should receive training on the organization's security procedures.
- If access is granted remotely there should be a communication device.
- There should be an auditable trail for usage of key cards and pins.
- Personnel should be required to wear some visible identification.
- All staff that might encounter visitors should be trained so that it is difficult for a social engineer to bypass physical security controls.
- Access rights to secure areas should regularly be reviewed, updated and, where necessary, revoked, and a record of the forum's review should form part of the ISMS documentation.

### 2.1.3 Securing Offices, Rooms and Facilities

A secure room may contain lockable cabinets or safes. Secure rooms could be any rooms within the premises but will certainly include server rooms, telecommunications rooms and plant (power and air-conditioning) rooms. Some other (such as accounts or HR, or directors' offices) might also need to be secured. CEOs' offices should also be treated as secure rooms. Secure area design should take account of the possibility of damage from fire, flood, explosion, civil unrest and other forms of natural or human-created disaster. The controls that ISO27002 recommends should be considered and, if appropriate, implemented include the following:

- Key storage areas and keyed entrance areas should be sited to avoid access by unauthorized persons and by the public.
- Building should be inconspicuous, and give little indication of their presence or purpose.
- Doors and windows should be locked when the room is unattended. Burglar bars should be considered for ground floor.
- Secure areas should be separated from third-parties.
- Internal directories or phone books or other information about locations of secure areas should not be accessible by the public.
- Hazardous material should not be bulk stored in a secure area.
- Backup equipment should not be stored with the equipment that they will back up.
